

*Q: What is a crypto cemetery?*

**A:** A crypto cemetery is a space where you can leave your digital footprint, and with the further development of AI, your digital footprint will be recreated into your digital twin.

*Q: When will this be possible?*

**A:** Based on the theory of Mind Uploading, [https://en.wikipedia.org/wiki/Mind\\_uploading](https://en.wikipedia.org/wiki/Mind_uploading)

the latest when this can happen is 2111, but possibly earlier.

Given the development of technology, this is difficult to predict, but our team will also develop AI that can perform this task.

*Q: Why is this needed?*

**A:** This is necessary in order to gain digital immortality, and possibly a new form of existence, as written in the White Paper of the project.

*Q: How to implement it?*

**A:** You need to bury your data and mint it in the same way as regular NFTs, and set the resurrection time, upon reaching which, the smart contract will start sending a transaction with the hashtag #resurrectme-010 Considering which, the AI that will be configured to do so will start restoring your digital twin.

*Q: What other opportunities can this project provide?*

**A:** We are developing «Dead Man Switch» a kind of analogue of a will, in which after a certain time of inactivity of the wallet, all assets from the address are redirected to the addresses that you will bequeath.

Your plot in the cemetery will be equated to a plot that, when the project develops, it will be a place in augmented reality or virtual reality. In other words, this is a virtual real estate object that you can use in the cross-chain metaverse.
